

Geospatial Data Access

The State of Tennessee, Office of Information Research – GIS Services provides sets of digital data to ETDD through a user agreement between ETDD and OIR. This data is provided to us based on a State Agency Sponsorship by the Department of Economic and Community Development. This data cannot be shared by us or used for commercial purposes; however, the GIS data greatly enhances our ability to assist communities in the District in their planning, grant application, and other processes.

OIR GIS Services has created countywide GIS data sets in Esri format consisting of the following features:

- Cadastral features **for participating counties** (parcels and other parcel-related features). This is data we can download from OIR periodically and it is essential to most of our GIS projects. (*Does not currently include Knox, Sevier, and Roane counties.*)
- Unintelligent Planimetric features (hydrography, street centerlines, etc.). This data contains no associated tabular data, such as name, size, type, etc.
- Digital ortho imagery.
- Miscellaneous data available from other sources that OIR - GIS Services publishes but does not maintain (census block boundary data, flood data, soils, etc.).

In addition to the GIS data from OIR, we have access to FEMA DFIRM data showing flood zones for the counties in the ETDD District. This data can be layered over aerial photography, parcel boundaries, corporate limits, and other data for analysis purposes.
